Freud Industrial Plastic Blades: LU94M Series

Thank you for shopping with us!

Application: Plexiglas & Plastics This industrial blade cuts acrylics, polycarbonates, and other plastics, which leaves a smooth finish without melting. By combining micrograin carbide tips with a specially modified triple chip grind, these blades will give a clean smooth cut. These blades produce less heat to keep the cut edge crisp. Premium TiCo™ HI-Density Carbide Plastic Blend for Maximum Performance. Modified Triple Chip Grind (MTCG) Tooth Design enables material to remain cool while cutting, eliminating melting. Negative Hook Angle produces a superior finish without grabbing the material. Silver Ice™ Coating resists corrosion and pitch buildup. Ideal For: Plexiglas and Plastics. Depth of cut (1/4" to 1-5/8"). **Tip:** For best results, set your saw so that the blade is exposed only enough that one half of a carbide tip protrudes beyond the material to be cut.
