Item #145301, Lamello Bisco P-14 Aligning Elements, 80 pieces \$50.00

Thank you for shopping with us! The Bisco P is a plastic element. The aligning element fits into the 7 mm wide P-System groove. However, it is not anchored with positive locking like the Clamex P, but instead clamps in the groove due to its surface structure. It can be used like a wooden biscuit with PVA glue as a fixed joint. The Bisco P is used in combination with the Clamex P only when every second connector needs to apply clamping force and an aligning element in between is sufficient for joint flushness as an invisible and cost-effective alternative. Another application is the use for test connections before a workpiece is joined with a Tenso P and adhesive. The clamping force of the Tenso P is very powerful and, depending on the angle of the workpieces, disassembly may require a lot of force. It is therefore advisable to check the precision of the machining with a Bisco P. The Biscos are then simply removed from the grooves, replaced by Tenso P, adhesive is then applied, and the workpieces are joined together. The Bisco P-14 is used in combination with the Clamex P-14 or Tenso P-14, the Bisco P-10 with connectors of size P-10. Applications: In combination with the Clamex P or Tenso P in furniture construction Applications similar to the Lamello original wooden biscuit Size P10: butt joints from a material thickness of 12 mm, mitre connections from a material thickness of 18 mm Size P14: butt joints from a material thickness of 15 mm, mitre connections from a material thickness of 18 mm

SPECIFICATIONS

Manufacturer	Lamello Tools
Part Desc	Bisco P-14 Aligning Element

SPECIFICATIONS	
Length	65mm
Width	7mm
Height	27mm
